Accommodation SINGLE Web Page

MODULE 2 FOUNDATION CODING SUMMATIVE

Joon Yoon

TIMELINE

- **Step 1**. User presses the "Reserve your stay" button on the landing page.
- **Step 2**. User inputs the "Check in" date and "Check out" date under Date & Guest tab of the modal.
- **Step 3.** User inputs the How many guests are staying under Date & Guest tab and press next button.
- **Step 4**. If user inputs 1 person for their accommodation, display the option of Hostel \$30/night and Hostel \$157/night. and proceed to Step 7.
- **Step 5**. If user inputs 2 people for their accommodation, display the option of Hostel \$157/night and Motel \$90/night. and proceed to Step 7.
- **Step 6**. If user inputs 3 or 4 people for their accommodation, display the option of House \$240/night and Motel \$90/night. and proceed to Step 7.
- **Step 7.** Out to filtered two options, user chooses one of the options and add breakfast.
- **Step 8.** Total cost including breakfast is calculated and displayed in the in the Total modal.

VARIABLES

 Use camelCase for identifier names (variables and functions). - All names start with a letter.

Example:

firstName = "Name";

SPACE AND OPERATORS

 Always put spaces around operators (= + - * / , and after commas.

Examples:

```
a = b + c; (a > b) && (a > c);
var values = ["John", "Sam", "Sarah"];
```

CODE INDENTATION

- Always use 2 spaces for indentation of code blocks.

(NOTE: Do not use tabs for indentation. Different editors interpret tabs differently).

Example:

```
function sayHelloName() {
} document.write ( 'Hello Name' );
}
```

FILE NAMES

- Use lower case file names.

GENERAL RULES FOR COMPLEX (COMPOUND) STATEMENTS

- Put the opening curly braces at the end of the first line.
- Use one space before the opening bracket.
- Put the closing bracket on a new line, without leading spaces.
- Do not end a complex statement with a semicolon.

Conditional example:

```
if ( name = John ) {
document.write ( "Welcome back John" ); } else {
} document.write ( "Please enter your correct
```

Function example:

```
function sayHelloName() {
} document.write ( "Hello Name" );
Loops example:
for (i = 0; i < 5; i++) {
```

STATEMENT RULES (SIMPLE)

- Always end a simple statement with a semicolon.

Example:

```
var values = { firstName: "John" ,
}; lastName: "Smith" ,
```

OBJECT RULES (SIMPLE)

- Short objects can be written compressed, on one line, using spaces only between properties separated by commas.

```
var person = { firstName: "John" ,
}; lastName: "Smith" ,
```

GENERAL RULES FOR OBJECT DEFINITION

- Place the opening bracket on the same line as the object name.
- Use colon plus one space between each property and its value.
- Use quotes around string values, not around numeric values.
- Do not add a comma after the last propertyvalue pair.
- Place the closing bracket on a new line, without leading spaces.
- Always end an object definition with a semicolon.
- When many properties are involved, span across multiple lines with one property-value pair on each line followed by a comma.

Example:

```
var person = { firstName: "John" , lastName: "Smith"
, age: 50 ,
eyeColor: "blue"
};
```

Short objects can be written compressed, on one line, using spaces only between properties, like this example:

```
var person = {firstName: "John" , lastName: "Smith" ,
age: 50 , eyeColor: "blue" };
```

LINE LENGTH

- For readability, avoid lines longer than 80 characters.
- If a Javascript statement does not fit on one line,
 the best place to break it, is after an operator or a comma.

```
var person = {
firstName: "John",
age: 48,
phoneNumber: 021 234 567, gender: "male"
};
```

JAVASCRIPT STYLE GUIDE

NAMING CONVENTIONS

- Variable and function names are written in camelCase.
- Do not use hyphens as they can be mistaken for subtracting attempts.
- Do not start names with a \$sign as it conflicts with many Javascript library names.

Example:

```
var person = { firstName: "John" , lastName: "Smith"
, age: 50 ,
eyeColor: "blue"
};
```

LOADING JAVASCRIPT IN HTML

 Use simple syntax for loading external scripts (the type attribute is not necessary).

Example (including folder path):

```
<script src="js/script.js"</script>
```

COMMENTS

- Use // for single line comments.
- Use /* for multiple line comments.

DECLARATION

- Declare all variables, arrays and objects in the beginning of statement blocks. - Initialize in the beginning to avoid errors.
- Declare loop variables before the use in loops for faster loading effects.

```
var person = { firstName: "John" , lastName : "Smith"
, id: 55555 ,
fullName : function() {
  return this.firstName + " " + this.lastName;
}
};
```

QUOTES

- Use double quotes for string values

Example:

```
var person = {
} firstName: "John" ,
```

- Use single quotes for apostrophes .

```
var person = {
} firstName: "James'" ,
}
```
